AMENDMENT TO THE CLAIMS

1-22 (Cancelled)

23. (New) A system comprising:

a memory to store IA-32 instructions;

an expanded logical register set including more than eight logical registers of a first type;

an bus coupled to said memory; and

IA-32 instruction set decoding logic coupled to the expanded logical register set and the memory via the internal bus,

wherein the IA-32 instruction set decoding logic is to determine whether a mod field of a ModR/M byte of an IA-32 instruction contains a predetermined value;

determine whether an r/m field of the ModR/M byte of the IA-32 instruction contains a predetermined value;

determine whether an index field of a scale index base (SIB) byte contains a predetermined value; and

decode an expanded logical register identifier.

- 24. (New) The system of claim 23, wherein said expanded logical register set includes up to sixteen logical registers of a first type.
- 25. (New) The system of claim 23, wherein said expanded logical register set includes up to thirty-two logical registers of a first type.

- 26. (New) The system of claim 23, wherein the more than eight logical registers of a first type include more than eight logical general integer registers.
- 27. (New) The system of claim 23, wherein the more than eight logical registers of a first type include more than eight logical multimedia extension technology registers.
- 28. (New) The system of claim 23, wherein the more than eight logical registers of a first type include more than eight logical SIMD (single instruction multiple data) floating-point registers.
- 29. (New) The system of claim 23, further comprising:

expanded register set decoding logic, coupled to said IA-32 instruction set decoding logic, to determine whether an instruction includes an at least four-bit register identifier, the at least four-bit register identifier to specify one logical register of said expanded logical register set.

- 30. (New) The system of claim 29, wherein said expanded register set decoding logic is to decode an at least four-bit identifier.
- 31. (New) The system of claim 30, wherein said expanded register set decoding logic is to decode the at least four-bit register based at least in part on at least four bits of a scale index base (SIB) byte of the instruction.

45210_1.DOC -3-

- 32. (New) The system of claim 31, wherein said expanded register set decoding logic is to decode the at least four-bit register based at least in part on at least one bit of a scale field of the scale index base (SIB) byte of the instruction.
- 33. (New) The system of claim 29, wherein said expanded register set decoding logic is to decode an at least five-bit register identifier.
- 34. (New) The system of claim 33, said expanded register set decoding logic is to decode the at least five-bit register based at least in part on five bits of a scale index base (SIB) byte of the instruction.
- 35. (New) The system of claim 34, wherein said expanded register set decoding logic is to decode the at least five-bit register based at least in part on two bits of a scale field of the scale index base (SIB) byte of the instruction.
- 36. (New) A set of instructions residing in a storage medium, said set of instructions capable of being executed by a storage controller to implement a method for processing data, the method comprising:

determining whether a mod field of a ModR/M byte of an IA-32 instruction contains a value selected from the values of 01B, 10B and 00B;

determining whether an r/m field of the ModR/M byte of the IA-32 instruction contains a value of 100B;

determining whether an index field of a scale index base (SIB) byte contains a value of 100B; and

decoding an at least four-bit logical register identifier.

- 37. (New) The set of instructions of claim 36, wherein decoding the at least four-bit logical register identifier is based at least in part on at least one bit of a scale field of a scale index base (SIB) byte of the IA-32 instruction.
- 38. (New) The set of instructions of claim 36, wherein the at least four-bit logical register identifier is an at least five-bit logical register identifier.
- 39. (New) The set of instructions of claim 38, wherein decoding an at least five-bit logical register identifier is based at least in part on two bits of a scale field of a scale index base (SIB) byte of the IA-32 instruction.
- 40. (New) A processor comprising:a logical register set including more than eight logical registers of a first type;instruction decoding logic coupled to the logical register set, said instruction decoding

a first comparator to determine whether a mod field of a ModR/M byte of an IA-32 instruction contains a value selected from the values of 01B, 10B, and 00B;

a second comparator to determine whether an r/m field of the ModR/M byte of the IA-32 instruction contains a value of 100B;

a third comparator to determine whether an index field of a scale index base (SIB) byte contains a value of 100B; and

a decoder to decode an at least four-bit logical register identifier.

45210_1.DOC -5-

logic including:

41. (New) The processor of claim 40, wherein the decoder to decode an at least four-bit logical register identifier is to decode the at least four-bit logical register identifier based at least in part on at least one bit of a scale field of a scale index base (SIB) byte of the IA-32 instruction.
